

Supporting our wealthy and comfortable life, the chemical industry, which is living together with nature, fosters the dream of mankind.

Introduction

The chemical industry is frequently described as quite difficult to understand by people outside of the industry. The chemical industry has been defined as "the industry that manufactures various products from various raw materials for various purposes by using primarily chemical technologies. However, like steel, those which are categorized separately are excluded." (Mr. Yoshiro Tokuhisa, "Is There A Future for The Chemical Industry?" published by Nihon Keizai Shimbun Co.)

Viewed that way, the scope of the chemical industry changes depending on what is categorized separately from among manufacturing that primarily uses "chemical technologies." Although there are various opinions, the statistics on which major charts and tables of this brochure are based conform to the category "17 - Chemical Industry" of the Standard Industrial Classification for Japan (second classification). Its contents are described in detail on Page 5.

Even among published government statistics, the definition of the chemical industry could differ due to differences in the purposes for compilation and use by ministries and agencies. For example, in the trade statistics of the Ministry of Finance, synthetic rubbers, artificial fibers, and materials for photos and movies are excluded from the "Chemical Industry" category and radioactive elements are included because the ministry uses the unified classification under an international treaty.

Moreover, there are cases in which pharmaceuticals are not treated as chemical products. An example is the ranking data of the world's chemical companies on Page 10.

Meanwhile, there are opinions that the scope of the chemical industry is wider. In such a case, plastic products or plastic products and rubber products are added to the "Chemical Industry." Total shipments of the former amounted to 35 trillion yen and the latter to 38 trillion yen in 2004. At any rate, the chemical industry ranks third in manufacturing after transportation machinery and electrical machinery.

** The statistics used in this brochure conform to the Standard Industrial Classification for Japan (second classification): "Chemical Industry."

Chemical Products That Meet The Needs of Various Fields

Products that chemical industry produces are used as raw materials and intermediary products by other industries. At the same time, many end products include drugs & medicines, cosmetics, detergents, paints, film and other materials that help us enjoy a comfortable modern life.

Financial figures converted at the 2004 average exchange rates of \$1.00 U.S. = 0.804 euros; 0.546 British pounds; 1.243 Swiss francs; 3.74 Saudi riyals; 108.15 Japanese yen; 1,145.24 South Korean won; 33.373 Taiwan dollars; 45.26 Indian rupees; 8.28 Chinese yuan; 6.44 South African rand; 6.74 Norwegian crowns; and 1.302 Canadian dollars.

a Operating profit is sales less administrative expenses and cost of sales.

Chemical operating profit as a percentage of chemical sales. Sales include a significant amount of nonchemical products.

Profits and profitablity rates are after-tax.

Excludes Lanxess.

Data represents the sums of Formosa Plastics Corp. and Formosa Chemicals & Fiber Corp., plus 40% of Nan Ya Plastics, and 25% of Formosa Petrochemical.

g Spun off in January 2005; pro forma data. def = deficit. na = not available. nm = not meaningful.

Drugs & medicines are excluded.

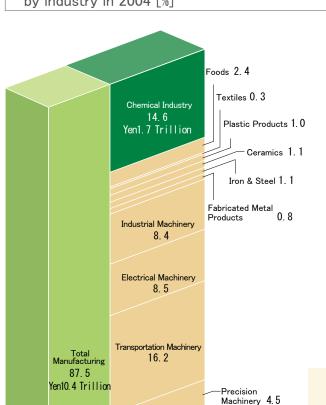

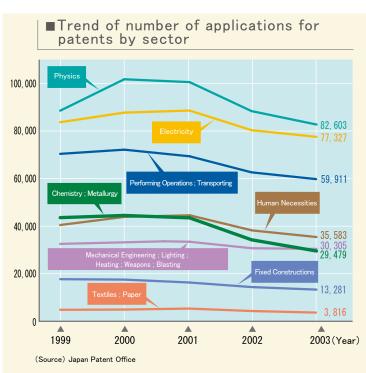

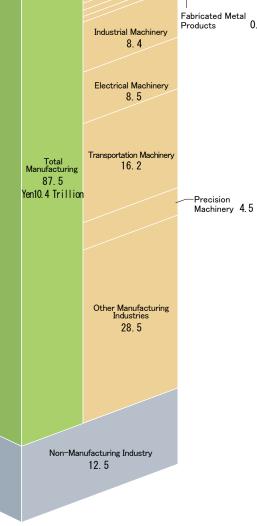

Yen 1,700 Billion Spent for Research And Development

Research and development expenditures of the chemical industry in FY 2004 (Apr.1, 2004 – Mar.31, 2005) in Japan amounted to yen 1,700 billion, accounting for 15% of all industry R&D expenditures. The percentage of research expenditures to sales was 5.2%, which was second highest after precision machinery.

Outward Direct Investment Amounts to Yen 380 Billion, While Inward Direct Investment Amounts to Yen 21 Billion

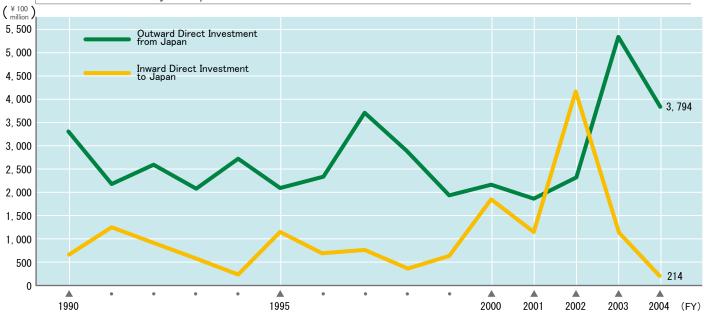

Inward direct investment dropped to the lowest level in the past 10 years in FY2004 due to increased investment in China and other countries by foreign companies.

Outward direct investment of the Japanese chemical industry and inward direct investment to the chemical industry in Japan in FY 2004 [¥ 100million]

■ Actual outward direct investment of the Japanese chemical industry and inward direct investment to the chemical industry in Japan

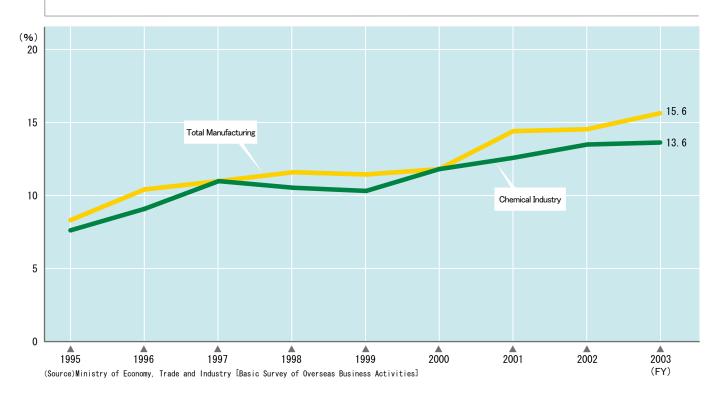

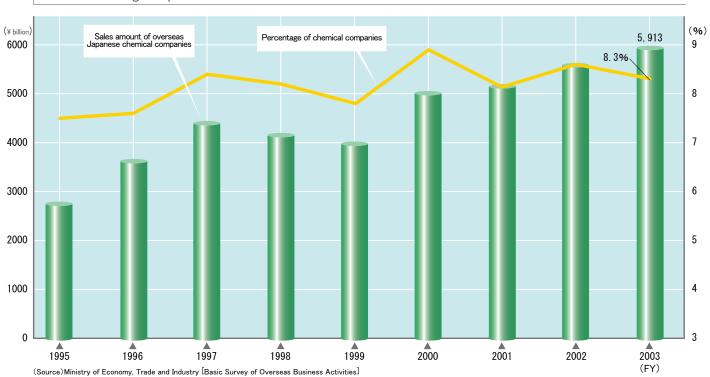

Overseas production of the Japanese chemical industry has amounted to over 14%.

■Trend of overseas production of Japanese companies

■ Sales of Japanese chemical companies based overseas and its percentage of all overseas Japanese manufacturing companies' sales

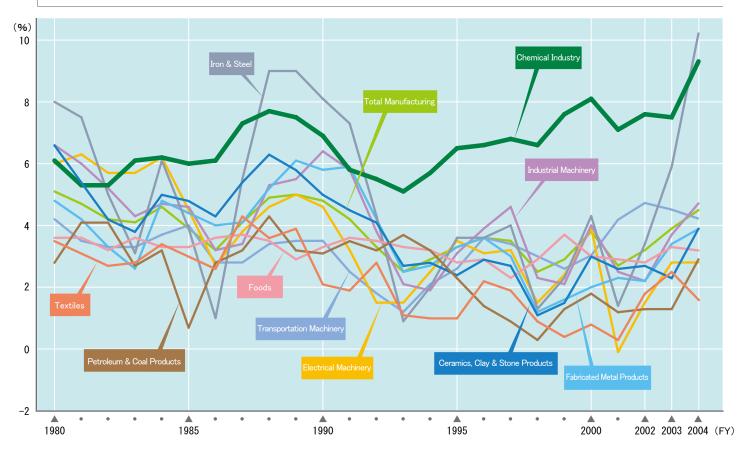

Operating Profit Ratio

Operating profit ratio to sales increased to 9.3%.

■Trend of ratio of operating profits to sales by industry

■Trend of ratio of operating profits to sales by industry [%]

Chemical Industry Supports Our Life and Other Industries, Protects The Earth and Realizes Our Dream

■ Chemical Industry and Technology and Social Needs

New materials to cope with "sick house" syndrome,Ultra light/ultra hard new materials, Fire retardant new materials, Heat-resist(heat accumulating) materials

Plant breeding by biotechnology, Factorization of agriculture, Highly functional packaging film materials/systems, Super enzymes

Allergy-free apparels, Waterproof and ventilation apparels, Form-memorizing apparels

Solar generation, Fuel cells, Use of biomass, High-level oil-chemicals technology Chemical Products, Technology and Activities That Meet The Needs of Various Fields

Display materials (LCD, PDP, EL, etc.), Clean automobiles, Ultra lightweight automobiles, Cellular phone materials, Optical fiber

Green chemistry, Measures to cope with global warming, Water treatment/water production, Prevention of atmospheric pollution (SOx, NOx, VOC, etc.), Biodegradable polymers, Measures to cope with environmental hormone issue

Biotechnology, Prevention of infection in hospitals, Genomic medicines

Nano Technology/New Materials

Carbon nano-tube, Organic electroluminescence

About Resposibile Care

What is Responsible Care? Chemical substances—necessary and important to modern daily life. However, sometimes these substances can turn dangerous, becoming hazardous to human health and safety and the environment when handled improperly. The task of preserving the environment and ensuring the health and safety of humans has increased in step with the rise of global environmental problems and the rapid industrialization of developing countries. Adding to this situation the potential hazards linked to advanced technology has made it difficult to ensure the ecological soundness and safety of chemical operations and products

simply by imposing laws and regulations. Thus, it is increasingly more important for companies that deal with chemical substances to undertake voluntary measures to ensure environmental preservation and human safety and health. Reflecting this trend, the world chemical industry started an initiative that promotes a voluntary management system aimed at preserving the environment against and ensuring the safety from chemical substances throughout the product's life cycle, from development through disposal. This initiative has been named "Responsible Care" (RC).

As a representative of the Japanese chemical industry and an important member of the global chemical industry, the JCIA promotes Responsible Care initiatives in cooperation with the ICCA. In 1990, the JCIA drew up "The Guiding Principles for the Improvement of Environmental, Health, and Safety Conditions." With the objective of promoting the implementation of the program in Japan, the JCIA established the Japan Responsible Care Council (JRCC) in 1995.

Responsible Care Logotype

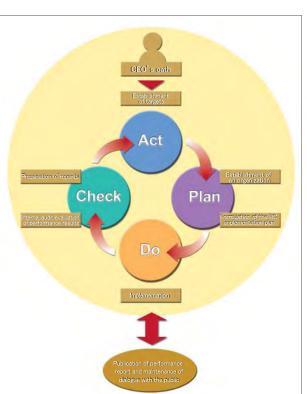

The logotype used to promote Responsible Care is authorized by the International Council of Chemical Associations (ICCA) as an international trademark for use by companies and organizations that implement Responsible Care programs. Permission to use the logotype is granted to member companies of chemical industry associations recognized by the ICCA. In Japan, the Japan Chemical Industry Association (JCIA), the Japan Responsible Care Council (JRCC), and member companies of the JRCC are exclusively authorized to use the logotype.

Procedures for Implementing RC Member companies implement RC in accordance with the Codes and Guidelines for the Implementation of Responsible Care.

RC should be implemented in accordance with the Plan-Do-Check-Act (PDCA) cycle.

Member companies should present their implementation plans and performance results to the JRCC annually by submitting a Responsible Care Implementation Plan, a Responsible Care Implementation Report, and a Responsible Care Internal audit Certificate.

Main Activities of Responsible Care

Responsible Care is a Voluntary Initiative with company's commitment to improve all aspects of Environment, Health and Safety and to communicate with the public about activities and achievement to ensure transparency on the following five considerations.

RC is a set of voluntary activities based on a public commitment by companies engaged in the manufacture or handling of chemical substances. RC covers all aspects of performance related to the manufacture and handling of chemical substances.

Environmental preservation (Protecting human health and preserving the natural environment)

 Operational safety and disaster prevention (Preventing disasters at facilities and minimizing damage in case of disaster)

Occupational safety and health (Protecting the safety and health of workers)

health of workers)

Product stewardship (Providing information relating to the properties and handling procedures of chemical products to protect the safety and health of all people handling the products and the environment)

RC requires companies to publicize their performance and maintain dialogue with the public; the approach aims to promote communications with the public and foster a better understanding of the role of companies that manufacture and handle chemical substances.

RC is a set of activities aimed at preserving the environment

and ensuring safety and health in all stages of chemical substance life cycles from development and manufacturing to distribution, use, final consumption, and disposal. (product stewardship)
